SUMMARY

I build and run full-cycle production services: from architecture and code to deployment on my own Linux servers, monitoring and supporting real users. My focus is Python back-end development (Telegram platforms, payment integrations, web dashboards) and network infrastructure: VPN, routing, nginx, Cloudflare. Comfortable in large unfamiliar Java codebases — I ported an open-source mod of 246 Mixin patches to a new Minecraft version.

CORE SKILLS

Backend	Python, aiogram 3, Telethon, async code, payment APIs (CryptoBot, YooKassa), Telegram WebApp, SQLite, PostgreSQL
Infrastructure	Linux, systemd, nginx, Docker, GitHub Actions, Cloudflare, cron
Networking	WireGuard / AmneziaWG, Xray, mihomo, nftables, dnsmasq, split tunnelling and policy routing
Java	Fabric, Mixin, Gradle, reading and adapting third-party code
Mobile / Front	TypeScript, React Native, Expo, Supabase, Firebase, HTML, CSS, JavaScript
Tools	Git, Playwright, Bash, PowerShell

PROJECTS

VAMOS VPN — commercial VPN service

2026 — present

Author · development and operations. Telegram bot and web dashboard selling and provisioning VPN access, serving real users.

- Designed an AmneziaWG back end: a dedicated peer key per user, traffic accounting and per-plan gigabyte limits.
- Implemented payments (CryptoBot, YooKassa), an internal balance, plans and a referral programme; invoice status is polled every 20 seconds.
- Built a Telegram WebApp dashboard behind Cloudflare → nginx → Python, authenticated via initData with HMAC-SHA256 signature checks.
- Set up routing: a split tunnel for all non-Russian traffic (~4,600 prefixes regenerated by cron) and dedicated egress for selected services through Cloudflare WARP with nftables.
- Operate it on my own Linux server: systemd services, SQLite, a single command reporting the status of the whole system.

`Python · aiogram 3 · SQLite · AmneziaWG · nftables · dnsmasq · nginx · Cloudflare · systemd`

dvpn — terminal VPN client

2026

Author. Cross-platform VPN client on top of the mihomo core with a TUI.

- TUI: pick a server from a subscription, sort by ping, live traffic and remaining quota.
- Protocols: VLESS (Reality, xhttp, gRPC), Hysteria2, Trojan, VMess, Shadowsocks.
- One-command install (PowerShell / curl) without admin rights, portable mode, automatic core download, system proxy management.
- Windows and Linux, distributed through GitHub Releases.

`Python · mihomo · PowerShell · Bash`

Carpet Fixes 1.21.11 — open-source mod port

2026

Open source. Unofficial port of a game-mechanics bug-fix mod (a fabric-carpet extension) to a new Minecraft version.

- Moved 246 bytecode Mixin patches onto the changed internal APIs of Minecraft 1.21.11.
- Worked through an unfamiliar codebase and two lines of the project (fxmorin's original and tomalbrc's 1.21 fork).
- Verified it in game; built with Gradle and released on GitHub.

`Java · Fabric Loader · Mixin · Gradle`

Bakery — mobile app

2025 — 2026

Cross-platform bakery app (Android / iOS) with a web admin panel.

- Catalogue, cart, favourites and checkout built with React Native + Expo and TypeScript.
- Realtime support chat on Supabase Realtime, push notifications via Firebase Cloud Messaging.
- Email and Google Sign-In (Supabase Auth), server-side logic in PostgreSQL (PL/pgSQL).
