SUMMARY

Second-year college student (Information Systems and Programming, graduating in 2027). Since 2026 I have been running my own Linux server with web services and Telegram bots: nginx, systemd, nftables, VPN tunnels, Cloudflare. I automate routine work in Python and Bash, package services in Docker and build them with GitHub Actions. I run my own gateway to language models and host local models, which is why LLMOps interests me most. I contribute to Horizon, an open-source project in Rust (26 merged PRs), and work together with AI coding agents.

CORE SKILLS

Linux	VPS administration, systemd (services, timers, memory limits), journald, key-based SSH, Bash
Networking	TCP/IP, DNS, NAT and routing, nftables / ufw, WireGuard / AmneziaWG, Tailscale, OpenWrt (QoS: SQM / cake)
Web	nginx (several sites, reverse proxy), Cloudflare (DNS, proxying, Workers)
CI/CD	Docker, Dockerfile (non-root, healthcheck), docker compose, GitHub Actions, GitHub Container Registry, ruff and hadolint linters
LLMOps	LiteLLM (gateway to several providers), Ollama (local models, quantisation, VRAM), Gemini API: strict JSON output, fallback models
Languages	Python, Bash, PowerShell, Java, SQL (SQLite, PostgreSQL), Git; English — comfortable reading technical documentation
Monitoring	healthchecks and watchdog scripts with auto-restart, journald logs
Learning	Kubernetes, Helm, Jenkins, Terraform

PROJECTS

intern-monitor — Dockerised bot with CI/CD

2026 — present

Open source. A Telegram bot that collects internships from hh.ru and Habr Career every 2 hours, filters out noise and has an LLM parse each vacancy. Running on my server since October 2026.

- GitHub Actions: ruff, hadolint and unit tests → image build with layer cache → smoke test → push to GitHub Container Registry (latest, sha and semver tags).
- Non-root Docker image (uid 10001), data in a separate volume, a heartbeat-based HEALTHCHECK; without its keys the bot stops at once with a clear error.
- Secrets come only from environment variables; each vacancy's state lives in SQLite, so after a restart the bot resumes where it left off and sends no duplicates.

`Python · SQLite · Docker · GitHub Actions · GHCR · Gemini API`

Horizon — open-source contributions in Rust

2026 — present

A port of Minecraft Java 26.3 to Rust (MIT): 26 merged PRs, 6 more in review. I write code with AI agents; the task, review and benchmarks are mine.

- Measured: 1.8–2.6× FPS with 150 players; +75–85% FPS with thousands of falling blocks; the world is saved when the server thread crashes.
- Every PR: an A/B benchmark of two builds and the project's CI: clippy, rustfmt, tests, a growth limit on big files.

Own server with web services and bots

2026 — present

I administer a Linux VPS end to end: setup, configuration, monitoring and fixes.

- 18 services under systemd (Python Telegram bots, vacancy and freelance-order monitors, web pages, an LLM gateway) with auto-restart and memory limits; the server has been up for over 70 days without a reboot.
- nginx serving several sites behind Cloudflare; an nftables firewall.
- WireGuard / AmneziaWG tunnels and policy-based routing of outbound traffic: some destinations go through Cloudflare WARP, exceptions are defined as nftables sets.
- It also runs VAMOS VPN: a Telegram bot and web dashboard (Telegram WebApp, initData signature checks) with CryptoBot and YooKassa payments, an AmneziaWG key and traffic accounting per user.

`Linux · systemd · nginx · nftables · WireGuard · Cloudflare`

LLM gateway and local models

2026

My own infrastructure for working with language models.

- LiteLLM on the server: one OpenAI-compatible API for several providers, automatic model list sync, failover to a spare key on errors.
- Ollama on my PC (RTX 3070 Ti, 8 GB): choosing quantisation and the split of layers between VRAM and RAM, tuning the KV cache and flash attention; a 23B-parameter MoE model runs at 24 tokens/s.
- LLMs in my bots: strictly JSON output with validation, a retry on the next pass and a fallback model on failures.

`LiteLLM · Ollama · Gemini API · Python`

Java development: Minecraft mods

2026

Open source: a Carpet Fixes port to Minecraft 1.21.11 (246 Mixin patches) and my own Fabric mods. More in the Java version of this resume.

`Java · Gradle · Fabric · Mixin`

EDUCATION

IT Moscow College (formerly MGKEIT)

2025 — 2027

Information Systems and Programming, full-time
