SUMMARY

Java developer specialising in Minecraft modding on Fabric. My main focus is porting large mods across game versions and mod loaders: getting into an unfamiliar codebase, moving it onto Minecraft's new internal APIs, patching vanilla code with Mixin and rewriting rendering, networking and GUI for the current version. I also write my own mods, contribute to Horizon, an open-source Minecraft port in Rust (26 merged PRs), and build Python back ends for my own Linux servers. I work with AI coding agents; the task, review and benchmarks are mine.

CORE SKILLS

Java	Java 21 / 25, Gradle, Fabric Loom, reading and adapting large third-party codebases
Modding	Fabric API, Mixin, Forge → Fabric porting, rendering (block entity renderers, OBJ models, RenderPipeline, particles), network packets, GUI, world generation, data packs (recipes, loot, tags)
Rust	Cargo, clippy, profiling and A/B benchmarks, tests, working in a large open-source project through pull requests and review
Backend	Python, aiogram 3, Telethon, payment APIs, Telegram WebApp, SQLite, PostgreSQL
Infrastructure	Linux, systemd, nginx, Docker, GitHub Actions, Cloudflare, WireGuard, nftables
Other	Git, TypeScript, React Native, Bash, PowerShell, AI coding agents (Claude Code, Codex)

PROJECTS

Horizon — Minecraft in Rust, open source

2026 — present

An independent port of Minecraft Java 26.3 to Rust (MIT): 26 merged PRs, 6 more in review. I write code with AI agents; the task, review and benchmarks are mine.

- Multiplayer: with 150 players, name tags and the hidden player list no longer cost frame time per player — 1.8–2.6× FPS.
- Thousands of falling blocks: +75–85% FPS (a model cache, fast spawning and removal; partly in review).
- Reliability: the world is saved when single player's server thread crashes, as vanilla Minecraft does (in review).
- Refactoring: split the game's main file (~13k lines) into modules in 14 PRs, each checked to be a pure move. A/B benchmarks, tests and CI (clippy, rustfmt) throughout.

Thaumcraft 6 → Minecraft 26.3 — large mod port

2026 — in progress

Porting the mod from Forge 1.12.2 to Fabric for Minecraft 26.3 (Java 25). Private repository: the original code may not be published.

- ~980 classes and ~124k lines: blocks, items, entities, research, world generation; rendering for the 26.3 pipeline (OBJ models, block entity renderers, custom RenderPipelines).
- Forge events → Fabric API and 32 Mixin patches, 42 network packets on CustomPacketPayload; mechanics checked against the original in game.

Carpet Fixes 1.21.11 — open-source mod port

2026

Open source. Unofficial port of a game-mechanics bug-fix mod (a fabric-carpet extension) to a new Minecraft version.

- Moved 246 bytecode Mixin patches onto the changed internal APIs of Minecraft 1.21.11.
- Worked through two lines of the project (fxmorin's original and tomalbrc's fork), tested in game, released on GitHub.

Own Fabric mods

2026

Open source, Minecraft 1.21.11. Client and server mods written from scratch.

- Totem Skins — client: a totem renamed to a player's name renders with that player's skin (new render pipeline).
- No F3 Coords hides F3 coordinates from non-ops; Bulk Whitelist and Deco Blocks add a bulk whitelist and decorative blocks.

VAMOS VPN — paid service

2026 — present

Author · development and operations. Telegram bot and web dashboard selling and provisioning VPN access, serving real users.

- An AmneziaWG peer key per user, traffic accounting and limits; payments (CryptoBot, YooKassa) and referrals; a Telegram WebApp dashboard behind Cloudflare → nginx with initData signature checks.

`Python · aiogram 3 · SQLite · AmneziaWG · nginx · systemd`

dvpn — terminal VPN client

2026

Author. A mihomo-based client for Windows and Linux: TUI with ping and live traffic, install without admin rights.

`Python · mihomo · PowerShell · Bash`

EDUCATION

IT Moscow College (formerly MGKEIT)

2025 — 2027

Information Systems and Programming, full-time
